#### (xv) Liquidity risk management

Liquidity risk is defined as the risk arising from the branch's potential inability to meet all payment obligations when they fall due or to only being able to meet these obligations at excessive costs. The branch's liquidity management model provides a framework to identify, monitor, mitigate and manage the liquidity and funding risks to which the branch is exposed. The framework ensures that roles and responsibilities are clearly defined and understood, in both normal and stressed liquidity conditions.

#### Liquidity risk governance

Treasury is responsible for the overall liquidity management of the Branch. Under the stewardship of local Treasury, Deutsche Bank Hong Kong Assets and Liabilities Committee provides the forum for managing capital, funding and liquidity and the interest rate risk in the banking book of the Branch.

Liquidity Risk Management acting as an independent control function, responsible for the oversight of liquidity and funding risk management strategy and the validation of Liquidity Risk models which are developed by Treasury, to measure and manage the liquidity risk profile.

Liquidity and Treasury Reporting and Analysis Team is responsible for the internal reporting on liquidity and funding across the firm on a global and local level.

Treasury and LRM work with businesses and relevant functional areas to identify the relevant inherent liquidity risks and look to ensure that they are controlled and mitigated through its liquidity management framework.

#### **Liquidity Management Tools**

Liquidity risk is managed through the main below items:

#### Internal Stress testing

Daily stress testing is one of the key tools for measuring liquidity risk and evaluating the Branch short-term liquidity position within the liquidity framework.

The stress testing approach is based on the use of Liquidity Risk Drivers, where each Liquidity Risk Drives reflects the potential liquidity outflows or inflows associated with different on and off-Balance sheet funding relevant items.

The Stressed Net Liquidity Positions reflect the Branch's ability to withstand certain defined stress scenarios - severe downgrade, emerging market and combined – through an eight-week horizon.

#### BAU Cash Flow Projection

The liquidity position under normal conditions is calculated to supplement the stress test for day-to-day liquidity management. The cash inflows and outflows from assets, liabilities and off-balance sheets items are projected based on their contractual maturities or behavioural assumptions without any stress elements.

In deriving behavioural cash-flow assumptions, the Bank analyses historical observations on cash-flow patterns. Treasury has to make sure assumptions used are consistent and reasonable and they are supported by sufficient historical or empirical evidence.

#### (xv) Liquidity risk management (continued)

#### Funding Matrix

Funding Matrix is the Branch's primary tool for monitoring and managing funding risk. The Funding Matrix assesses the Branch's structural funding profile for the greater than one year time horizon.

All funding-relevant assets and liabilities are mapped into time buckets corresponding to their maturities. The liquidity maturity profile is based on contractual cash flow information. If the contractual maturity profile of a product does not adequately reflect the liquidity maturity profile, it is replaced by modelling assumptions. This enables the identification of expected excesses and shortfalls in term liabilities over assets in each time bucket, facilitating the management of potential liquidity exposures.

#### Liquidity Dashboard and Early Warning Indicators

The liquidity Dashboard monitors a number of the Group's specific liquidity risk and market indicators which are considered to provide early warning indicators of deteriorations in the bank's liquidity risk profile and financial market conditions.

#### **Contingency Funding Plan**

The branch's CFP outlines how the branch would respond to an actual or anticipated liquidity risk scenario. This includes a decisive set of actions that can be taken to raise cash and/ or recover branch's liquidity metrics in a stress scenario.

#### **Liquidity Cushion**

The Branch maintains a liquidity cushion that is largely made up of the most liquid and readily marketable assets. The bank defines the following liquid assets can be included in its liquidity cushion:

- Cash on hand
- Unencumbered exchange Fund debt securities.
- Other unencumbered high quality government debt securities or similar instruments that can be easily or immediately monetized at all times irrespective.

The Branch also diversifies the maturity bucket of debt securities to minimise re-financing risks.
